

Bytes Base Assistant

Context-aware AI for collaborative learning

User Guide

1. Disclaimer

This assistant operates exclusively within the platform's content ecosystem. Responses are generated using posts, discussions, and media available within the community — no external data sources are consulted.

The assistant is designed to support collaborative learning by surfacing shared knowledge contributed by platform members. It facilitates discovery of relevant content and encourages peer-driven exploration of technical topics.

By design, this assistant functions within a closed academic ecosystem. Its responses are scoped to available platform content and are intended to complement — not replace — structured learning, instructor guidance, or authoritative documentation.

2. How It Works

The assistant processes each query through a structured pipeline that combines content retrieval with context-aware response generation.

Processing Flow

Each query follows these steps in sequence:

1. Identifies the current post and extracts its topic, tags, and key concepts.
2. Retrieves related content — posts, threads, and videos — ranked by relevance.
3. Generates a response grounded in the retrieved context, with citations where applicable.

Behaviour by Query Intent

The assistant adapts its retrieval strategy based on the nature of the query:

Understanding queries

- Focused on the current post only
- Aimed at clarifying concepts, definitions, or logic within the post
- No external suggestions unless explicitly requested

Exploration queries

- Retrieves related posts and supplementary videos from the platform
- Surfaces connections across topics to support broader learning
- Presents suggestions in ranked order by relevance

Output Characteristics

Every response is structured for clarity and actionability:

- Clear, structured explanations tailored to the query
- Context-aware suggestions linked to platform content
- Follow-up questions to guide deeper exploration

3. Suggested Workflow

To get the most accurate and useful responses, follow this recommended workflow:

- Ask specific questions about the current post — reference exact terms, steps, or concepts you want clarified.
- Use follow-up queries to deepen understanding within the same topic thread before moving on.
- Explore suggested posts and videos returned by the assistant to expand your knowledge laterally.
- Refine vague or broad queries into precise, scoped questions to improve response accuracy.

4. Rate Limit

To maintain platform performance and fair access, the assistant enforces a query rate limit per user session:

- Maximum of 20 queries per minute per user
- Requests exceeding this limit will be paused until the current window resets
- If you receive a rate limit notice, wait 60 seconds before submitting the next query

Implementation Overview

This product is conceptually inspired by the YouTube AI Assistant. However, it does not involve copying or referencing their source code, core architecture, or tech stack. It is independently designed and developed using original approaches and a distinct implementation strategy to meet its intended goals.
